Analysis Report

Global dataset report

This report is the output of the Amazon SageMaker Clarify analysis. The report is split into following parts:

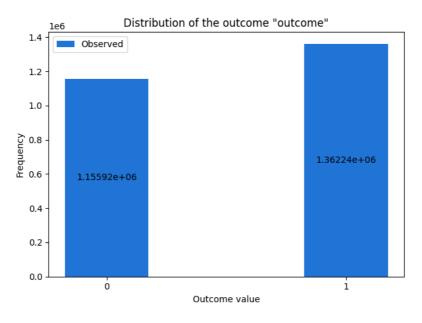

- 1. Analysis configuration
- 2. Pretraining bias metrics

Analysis Configuration

Bias analysis requires you to configure the outcome label column, the facet and optionally a group variable. Generating explanations requires you to configure the outcome label. You configured the analysis with the following variables. The complete analysis configuration is appended at the end.

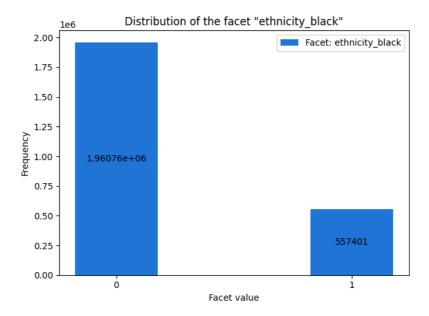

Outcome label: You chose the column outcome in the input data as the outcome label. Bias metric computation requires designating the positive outcome. You chose outcome = 0 as the positive outcome. outcome consisted of values [0, 1].

The figure below shows the distribution of values of outcome .

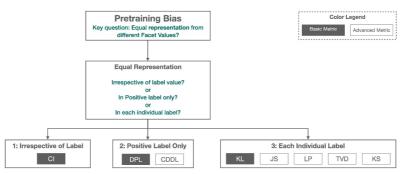

Facet: You chose the column ethnicity_black in the input data as the facet. ethnicity_black consisted of values [0, 1]. Bias metrics were computed by comparing the inputs ethnicity_black = 1 with all other inputs, then by comparing inputs ethnicity_black = 0 with all other inputs.

The figure below shows the distribution of values of ethnicity_black .

Pre-training Bias Metrics

Pretraining bias metrics measure imbalances in facet value representation in the training data. Imbalances can be measured across different dimensions. For instance, you could focus imbalances within the inputs with positive observed label only. The figure below shows how different pretraining bias metrics focus on different dimensions. For a detailed description of these dimensions, see <u>Learn How Amazon SageMaker Clarify Helps Detect Bias</u>.

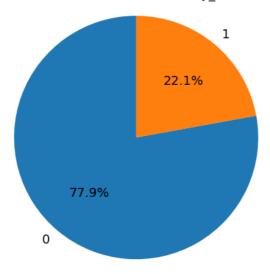

The metric values along with an informal description of what they mean are shown below. For mathematical formulas and examples, see the <u>Measure Pretraining Bias</u> section of the AWS documentation.

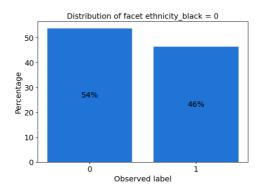

We computed the bias metrics for the label outcome using label value(s)/threshold outcome = 0 for the following facets:

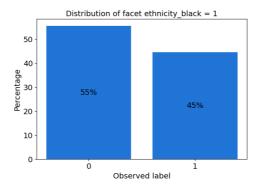

Facet column: ethnicity_black
 The pie chart shows the distribution of facet column ethnicity_black in your data.

Distribution of facet ethnicity_black

The bar plot(s) below show the distribution of facet column ethnicity_black in your data.

Facet Value(s)/Threshold: ethnicity_black = 1

Metric	Description	Value	Error
Conditional Demographic Disparity in Labels (CDDL)	Measures maximum divergence between the observed label distributions for facet values Sex=0 and rest of the inputs in the dataset.	None	Error: see Clarify job output
Class Imbalance (CI)	Measures the imbalance in the number of inputs with facet values Sex=0 and rest of the inputs.	0.557	None
Difference in Proportions of Labels (DPL)	Measures the imbalance of positive observed labels between facet values $Sex=0$ and rest of the inputs.	0.018	None
<u>Jensen-Shannon</u> <u>Divergence (JS)</u>	Measures how much the observed label distributions of facet values Sex=0 and rest of the inputs diverge from each other entropically.	0.000	None
<u>Kullback-Leibler</u> <u>Divergence (KL)</u>	Measures how much the observed label distributions of facet values Sex=0 and rest of the inputs diverge from each other entropically.	0.001	None
Kolmogorov-Smirnov (KS)	Measures maximum divergence between the observed label distributions for facet values $Sex=0$ and rest of the inputs in the dataset.	0.018	None
<u>Lp-norm (LP)</u>	Measures a p-norm difference between the observed label distributions associated with facet values Sex=0 rest of the inputs in the dataset.	0.025	None
Total Variation Distance (TVD)	Measures half of the L1-norm difference between the observed label distributions associated with facet values Sex=0 and rest of the inputs in the dataset.	0.018	None
Facet Value(s)/Threshold	l: ethnicity_black = 0		
Metric	Description	Value	Error
Conditional Demographic Disparity in Labels (CDDL)	Measures maximum divergence between the observed label distributions for facet values Sex=0 and rest of the inputs in the dataset.	Value None	Error: see Clarify job output
Conditional Demographic	Measures maximum divergence between the observed label distributions for		Error: see Clarify job
Conditional Demographic Disparity in Labels (CDDL)	Measures maximum divergence between the observed label distributions for facet values Sex=0 and rest of the inputs in the dataset. Measures the imbalance in the number of inputs with facet values Sex=0 and	None	Error: see Clarify job output
Conditional Demographic Disparity in Labels (CDDL) Class Imbalance (CI) Difference in Proportions	Measures maximum divergence between the observed label distributions for facet values Sex=0 and rest of the inputs in the dataset. Measures the imbalance in the number of inputs with facet values Sex=0 and rest of the inputs. Measures the imbalance of positive observed labels between facet values Sex=0	None -0.557	Error: see Clarify job output None
Conditional Demographic Disparity in Labels (CDDL) Class Imbalance (CI) Difference in Proportions of Labels (DPL) Jensen-Shannon	Measures maximum divergence between the observed label distributions for facet values Sex=0 and rest of the inputs in the dataset. Measures the imbalance in the number of inputs with facet values Sex=0 and rest of the inputs. Measures the imbalance of positive observed labels between facet values Sex=0 and rest of the inputs. Measures how much the observed label distributions of facet values Sex=0 and	None -0.557 -0.018	Error: see Clarify job output None
Conditional Demographic Disparity in Labels (CDDL) Class Imbalance (CI) Difference in Proportions of Labels (DPL) Jensen-Shannon Divergence (JS) Kullback-Leibler	Measures maximum divergence between the observed label distributions for facet values Sex=0 and rest of the inputs in the dataset. Measures the imbalance in the number of inputs with facet values Sex=0 and rest of the inputs. Measures the imbalance of positive observed labels between facet values Sex=0 and rest of the inputs. Measures how much the observed label distributions of facet values Sex=0 and rest of the inputs diverge from each other entropically. Measures how much the observed label distributions of facet values Sex=0 and	None -0.557 -0.018 0.000	Error: see Clarify job output None None
Conditional Demographic Disparity in Labels (CDDL) Class Imbalance (CI) Difference in Proportions of Labels (DPL) Jensen-Shannon Divergence (JS) Kullback-Leibler Divergence (KL)	Measures maximum divergence between the observed label distributions for facet values Sex=0 and rest of the inputs in the dataset. Measures the imbalance in the number of inputs with facet values Sex=0 and rest of the inputs. Measures the imbalance of positive observed labels between facet values Sex=0 and rest of the inputs. Measures how much the observed label distributions of facet values Sex=0 and rest of the inputs diverge from each other entropically. Measures how much the observed label distributions of facet values Sex=0 and rest of the inputs diverge from each other entropically. Measures maximum divergence between the observed label distributions for	None -0.557 -0.018 0.000 0.001	Error: see Clarify job output None None
